Shorter colds and milder symptoms among children who use ColdZyme

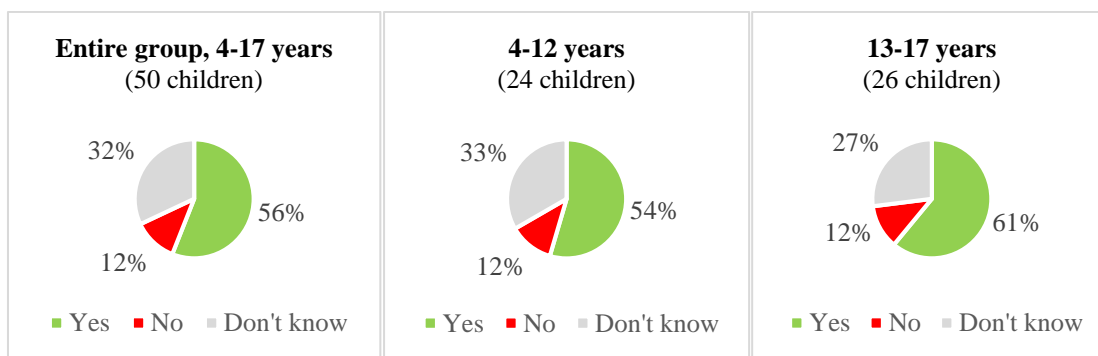

A user survey conducted by IPSOS shows positive results with use of ColdZyme® against common colds in children. According to the parents who were interviewed, a majority of the younger children (ages 4 to 12 years) experienced fewer days with common cold and milder symptoms. About one third responded that ColdZyme had protected their children from catching colds. Most of the parents would recommend ColdZyme to other families with children.

In a survey conducted by IPSOS on behalf of Enzymatica in 2019, ColdZyme was evaluated by parents of 50 children aged 4 to 17 years. A majority of the parents felt that common colds have a strong or very strong effect on the quality of life of their children. The survey results showed that the majority of the children used ColdZyme when they experienced the first common cold symptoms.

According to the parents, a majority of the younger children (ages 4 to 12 years) experienced fewer days with common cold symptoms and these symptoms were milder when using ColdZyme. About one third responded that ColdZyme had protected their children (both younger and older children) from common colds. Most of the parents felt that the instructions for using ColdZyme are easy to read and understand, and they would recommend ColdZyme to other parents for their children.

The evaluation also shows that reporting of side effects is very low. Among younger children, some form of side effect was reported in 8%. No side effects were reported among teens aged 13-17 years.

“The survey shows that the participating parents are satisfied with the efficacy of ColdZyme and that the product is well tolerated – which is in line with the results from similar studies,” says Fredrik Lindberg, CEO of Enzymatica.

Do you believe that your child experienced milder symptoms when using ColdZyme, compared with colds when ColdZyme was not used?
